

PROJECT----- StudyMate-----

Student Learning and Academic Management System

USE CASE DIAGHRAM:

SOFTWARE DESIGN AND ARCHITECTURE LAB

2. How do we choose the use cases?

Use cases are chosen by identifying the main functions that users need to perform in the system. For the StudyMate system, we first identify the main actors: Student, Teacher, and Admin. Then, we identify the activities each actor performs. For example, students can view courses, access study materials, submit assignments, attempt quizzes, view attendance, marks, and GPA. Teachers can manage courses, materials, assignments, quizzes, attendance, and marks, while the Admin manages users, departments, and courses. These important user-system interactions are selected as use cases.

3. What is the need for a Use Case Diagram in a project?

A Use Case Diagram is needed to show the functional requirements of a system in a simple and understandable way. In the StudyMate project, it shows how Students, Teachers, and Admins interact with the system and what functions each actor can perform. It helps the development team understand the system requirements, defines the system boundary, identifies the responsibilities of different users, and provides a clear foundation for further design, architecture, and implementation of the project.

LAB 3COMPLETED .
